

# DibVeillance

**The Ultimate All-in-One Surveillance and Access Control Solution**

Dibveillance is a groundbreaking all-in-one security solution that seamlessly integrates enterprise video surveillance and advanced access control. With unparalleled control over watchlists and access barriers, organizations can transform their security management, enhance infrastructure, and ensure comprehensive protection.

## Product Feature

<b>High-performance Face Identification</b>	<p>Accurately identifies faces in challenging conditions, including low-quality images and partial obstructions.</p>
<b>Liveness Detection</b>	<p>Effectively detects and prevents spoofing attempts through passive checks and real-time notifications.</p>
<b>Insights Beyond Identification</b>	<p>Dibveillance employs passive liveness checks and real-time notifications to effectively detect and prevent spoofing attempts, ensuring robust protection against unauthorized access to premises. By continuously verifying the authenticity of individuals, the system guarantees enhanced security measures and maintains a vigilant stance against fraudulent activities.</p>
<b>Robust Human</b>	<p>Dibveillance excels in tracking individuals across multiple frames, storing detected faces until they leave the camera's field of view. Its dynamic biometric template updates ensure exceptional accuracy, even when faced with challenges such as face masks or gradual changes in facial attributes. Notably, the system performs face detection and tracking seamlessly in parallel video streams, ensuring both speed and accuracy are maintained without compromise.</p>
<b>Integrated Access Control</b>	<p>The integrated video surveillance system takes security to the next level by automatically managing gates/doors, safeguarding the organization from unauthorized access. With access control integration at the database level, it provides foolproof protection and captures images in cases of denied access or unauthorized entry attempts.</p>
<b>Automatic Operation and Monitoring</b>	<p>Dibveillance can be configured to automatically report events such as watch-list matches and perform automatic enrollment from video streams. The main screen of the application is the Security Dashboard, that displays a preview of the selected cameras and a list of the latest security events such as the history of the identified people.</p>
<b>Smart Notificaion</b>	<p>Monitoring a number of screens is exhausting, inefficient, and time-consuming. Dibveillance's notification mechanism overcomes these issues by allowing precise configuration of events and situations that will trigger a notification or an alert worthy enough to be mentioned by an operator. Alerts can be sent to other systems like smartphone applications or emails.</p>
